

PRACTICAL GUIDE FOR CLIENTS AND SMALL TEAMS | 2026 EDITION

From Client Call to Tracked Task

Turn calls, voice notes, emails, and messages into organized requests, assigned tasks, and client-ready confirmations.

Fewer lost requests. More clarity. Visible human control.

ONE SHARED REGISTER	AI-ASSISTED STRUCTURE	VISIBLE NEXT ACTION
Calls, emails, and messages in one system.	GPT or Codex organizes. A person verifies.	Owner, deadline, status, and follow-up.

INCLUDES A READY-TO-USE CLIENT REQUEST TRACKER

Google Sheets / Excel - adaptable to ClickUp and other tools

Turn a conversation into controlled work.

A request does not become manageable because someone remembers it. It becomes manageable when it is recorded, verified, assigned, tracked, and confirmed.

1 RECEIVE THE REQUEST

The client may call, send an email or message, or speak during a meeting.

2 CAPTURE A SHORT SUMMARY

Write or dictate what the client requested without searching for perfect words.

3 STRUCTURE THE INFORMATION

GPT or Codex prepares the client, request, missing data, deadline, and next action.

4 REVIEW AND APPROVE

A person verifies the data before the system is changed.

5 TRACK AND CONFIRM

The request enters the spreadsheet or management tool, and the client receives written confirmation.

CORE RULE

Do not force the client to change how they communicate. Create an internal process that turns every conversation into traceable work.

The call ends, but the manual work begins.

The problem is not receiving calls. The problem is leaving important requests inside conversations, personal notes, or memory.

AFTER THE CALL	WHAT CAN GO WRONG
Remember the request	Details, amounts, or files are forgotten.
Open the spreadsheet	The request is never recorded.
Create the task	No owner is assigned.
Set the deadline	The date was never actually confirmed.
Write to the client	The agreement remains unclear or only verbal.
Update the status	No one can see the next action.

BEFORE

"Okay, I will remember it."

The request remains in a phone call, sticky note, or chat.

AFTER

Request recorded, missing information visible, owner assigned, and confirmation sent to the client.

Seven elements turn a call into a task.

When one of these elements is missing, apparent speed increases while control decreases.

1 TRIGGER

Call, email, WhatsApp message, meeting, or voice note.

2 INPUT

Original request, client data, files, dates, and confirmed notes.

3 AI TASKS

Extract, summarize, classify, and prepare a draft.

4 HUMAN REVIEW

Verify facts, priority, owner, deadline, and commitments.

5 SYSTEM UPDATE

Add the request to the spreadsheet, ClickUp, or connected tool.

6 CLIENT CONFIRMATION

Send a written recap and request missing information.

7 OUTPUT

Tracked request with visible status, next action, and closure.

OPERATING PRINCIPLE - AI prepares the record. A responsible person confirms the data and authorizes the system update.

You do not need to build the spreadsheet from scratch.

GPT or Codex can design the structure, create an initial file, and help adapt it to your process. Quality depends on the information, rules, and controls you define.

GPT CAN HELP YOU CREATE

An operational spreadsheet with columns, dropdowns, formulas, filters, and formatting.

A downloadable template in Excel or compatible spreadsheet format.

A dashboard showing open, overdue, urgent, and completed requests.

Control rules for missing data, deadlines, and approvals.

CODEX CAN HELP YOU CREATE

The file and system logic, even from a natural-language description.

Integrations and automations using available APIs, plugins, or MCP.

Dashboards and small apps connected to the process.

Technical controls, testing, and error handling.

CREATING THE FILE DOES NOT MEAN IT IS ALREADY CONNECTED

GPT or Codex can prepare the spreadsheet without access to your Google Drive. To read or modify an existing spreadsheet directly, an authorized connection is required: an app, plugin, API, or compatible MCP server.

The first test should use fictional or non-sensitive data. Only after testing should actions on the real system be authorized.

Connect the tool before updating a spreadsheet or management system.

AI cannot automatically modify “any tool.” A supported, authorized, and tested connection must exist.

USEFUL TERMS

ENVIRONMENT	TYPICAL CONNECTION	WHAT IT ENABLES
ChatGPT	Connected apps / plugins / MCP apps	Read data and, when supported and authorized, perform actions.
Google Workspace	Google Drive app with actions for Docs, Sheets, and Slides	Access files and use available actions with granted permissions.
Codex	Plugin, API, or MCP	Build the system, use approved tools, and automate technical steps.
External management tools	Native plugin, API, or MCP server	Create or update records only if the integration exposes that action.

MINIMUM CONTROL - Verify the file identity, permissions, required fields, and action content. Dates, priorities, and client commitments must not be invented.

Record only the information needed to act.

Every field must have an operational purpose. Missing data is marked “To confirm,” not completed by assumption.

FIELD	PURPOSE
Request ID	Identifies the request without ambiguity.
Date received	Shows how long the request has been open.
Client and contact	Identify the organization and contact person.
Original request	Preserves what was actually requested.
Category	Organizes the work and reporting.
Missing information	Prevents work from starting with incomplete data.
Priority	Applies agreed criteria, not AI impressions.
Owner	Establishes who must act.
Deadline	Records the confirmed date.
Status	Shows the current point in the process.
Next action	Defines the immediate next step.
Source	Call, email, WhatsApp, meeting, or form.
Confirmation sent	Closes the communication loop.

RULE - If priority, owner, or date is unknown, record “To confirm” and request human approval.

Start with a shared, readable register.

The included file contains dropdowns, statuses, priorities, deadlines, a dashboard, and a completed example.

ID	CLIENT	REQUEST	MISSING INFO	PRIORITY	OWNER	DEADLINE	STATUS	NEXT ACTION
CR-001	Alfa Realty	Update brochure to \$450,000	Confirm the file	High	Peter	07/24/26	To clarify	Request file confirmation
CR-002	Beta Studio	Send meeting recap	-	Medium	Peter	07/22/26	In progress	Send for approval

RECOMMENDED STATUSES

New
To clarify
In progress
In approval
Completed
Cancelled

RECOMMENDED PRIORITIES

Low
Medium
High
Urgent

Define the criteria first. AI must not determine urgency only from the client's tone.

OPERATIONAL FILE INCLUDED

Client Request Control System - ready for Excel and importable into Google Sheets. Adapt categories, owners, statuses, and rules to your business.

A phone call becomes a controlled request.

The value is not in perfect wording. It is in turning a conversation into verifiable data and assigned work.

ORIGINAL REQUEST

"Hi, can you change the price in the brochure and send it to me soon?"

FIELD	CONFIRMED INFORMATION
Client	Alfa Realty
Contact	Mark
Request	Update the brochure price
New price	\$450,000
Requested date	Friday
Missing information	Which file must be modified
Owner	Peter
Status	To clarify
Next action	Ask the client to confirm the file

WHAT CHANGED

- The request no longer depends on memory.
- Missing information is visible.
- The owner and next action are clear.
- The client can correct or confirm the agreement.

Describe the call as you would explain it to a colleague.

You do not need to follow a rigid formula. The system must know the required fields, boundaries, and approval point.

NATURAL INSTRUCTION EXAMPLE

I have just spoken with Mark from Alfa Realty. He wants the brochure price updated to \$450,000 and the new version by Friday. The correct file still needs to be confirmed. Prepare the request for the client register, assign it to Peter, set the status to "To clarify," and draft a confirmation message. Before modifying the system, show me every field you intend to add.

EXPECTED RESPONSE

- Client
- Contact
- Request
- Price or amount
- Deadline
- Missing information
- Owner
- Status
- Next action
- Confirmation message

WHAT IT MUST NOT DO

- Invent a deadline.
- Treat "soon" as absolute urgency.
- Assign a person without authorization.
- Promise dates or results to the client.
- Modify the system before confirmation.

THE VALUE IS NOT IN THE PERFECT PROMPT - It is in the agreed structure, required fields, and review before action.

Review the request before it enters the system.

Review must be proportionate to the impact, data used, and commitments created for the client.

- ☐ The client and contact are correct.
- ☐ The original request has not been changed in meaning.
- ☐ Names, dates, prices, amounts, links, and files are verified.
- ☐ Missing information is clearly identified.
- ☐ Urgency has not been inferred without criteria.
- ☐ The owner is authorized and available.
- ☐ The deadline is confirmed.
- ☐ No unauthorized promises have been created.
- ☐ Unnecessary personal data has been removed.
- ☐ The next action is clear.
- ☐ The user has approved the system update.

APPROVAL RULE - AI prepares the operational record. A responsible person approves facts, priorities, deadlines, ownership, and commitments.

Use Google Sheets for a simple shared register.

It is suitable for solo professionals, small businesses, and teams with a low or moderate volume of requests.

BEST WHEN

- There is no shared task manager yet.
- The process is simple with few owners.
- Shared visibility is needed for requests, deadlines, and status.
- The team wants to start with a low-cost, adaptable test.

LEVEL 1 - ASSISTED

GPT or Codex prepares the structured row.

A person reviews and copies the data into the spreadsheet.

This is the simplest way to test the workflow.

LEVEL 2 - CONNECTED

Connect the Google Drive app or an authorized integration.

After approval, an available action may create or update the record.

Always test with fictional data.

VOICE NOTE / TEXT STRUCTURED DATA HUMAN CONFIRMATION NEW ROW

IMPORTANT - In ChatGPT, actions for Docs, Sheets, and Slides may be available through the connected Google Drive app. Availability depends on plan, permissions, and configuration. Do not show an automatic update in a video unless it has actually been tested.

Use a task manager when work must be assigned and tracked.

The process does not change. Only the destination system and fields exposed by the integration change.

REQUEST REGISTER	TASK MANAGER FIELD
Request ID + client	Task title
Original request	Description
Client	Custom field
Owner	Assignee
Deadline	Due date
Priority	Priority
Status	Task status
Missing information	Comment or custom field
Next action	Checklist or subtask
Source	Custom field

BEST FOR

- Teams with multiple owners.
- Requests that generate subtasks.
- Dependencies, approvals, and follow-ups.
- Higher activity volume.

CONNECTION

Use the available plugin or app. When none exists, a custom API or MCP server may be required. Codex can help build and test the integration, but credentials, permissions, and actions exposed by the management tool are required.

Close the loop with a verifiable message.

Written confirmation reduces misunderstandings and lets the client correct details, dates, or files.

REQUEST RECEIVED

We have received your request regarding [TOPIC]. We are reviewing it and will confirm the next step by [DATE].

MISSING INFORMATION

To proceed correctly, we still need: [LIST]. Once received, we can confirm the delivery date.

WORK CONFIRMED

As agreed, [OWNER] will complete [REQUEST] by [DATE]. We will contact you if additional information is needed.

REQUEST COMPLETED

The request has been completed. You can find the result here: [LINK]. Please confirm approval or send corrections by [DATE].

CONTROL - Always verify names, dates, amounts, files, recipients, and any sentence that may create a commitment.

Build the first version in 15 minutes.

Start with a fictional case, measure the corrections needed, and connect tools only after defining rules and responsibilities.

- 1 Open or import the Client Request Tracker.
- 2 Adapt categories, statuses, owners, and priorities.
- 3 Choose who can approve requests and deadlines.
- 4 Connect the app or plugin only when necessary.
- 5 Test the workflow with a fictional call.
- 6 Review the data proposed by AI.
- 7 Approve the system entry.
- 8 Generate the written client confirmation.
- 9 Repeat with three low-risk real cases.
- 10 Record errors, exceptions, and time saved.

DEFINITION OF DONE

A request is under control when its source, client, requested outcome, missing information, owner, deadline, status, and next action are visible and verified.

Do you receive requests through multiple channels?

A Mini Workflow Review can identify where information is lost, which fields are needed, what AI can prepare, what requires approval, and which integration to test first.

aipmlab.propertydex.xyz/resources

Features, permissions, and availability may change.

Before publishing a demonstration, always verify that the app or plugin is available on your plan and that the write action is actually authorized.

CHATGPT AND CONNECTED APPS

Apps connect ChatGPT to external tools, information, and actions. Custom apps can be built through MCP.

GOOGLE DRIVE / SHEETS

Actions for Google Docs, Sheets, and Slides may be available through the unified Google Drive app. Permissions and enablement may depend on the plan and workspace administrator.

CODEX AND PLUGINS

Plugins can extend Codex with apps, skills, and templates. Custom systems may require APIs or MCP apps.

WRITE ACTIONS

The ability to create or modify records depends on actions exposed by the integration, granted permissions, and required confirmations.

GOOD PRACTICE

Use fictional data during setup, apply least privilege, and maintain human review for deadlines, priorities, and client commitments.
