

PRACTICAL AI GUIDE | DAY 4 OF 30 | 2026 EDITION

# The RIFORMA Method

7 elements to turn generic requests into usable AI outputs.

**Fewer attempts. More clarity. Visible human review.**

| PROBLEM                       | METHOD              | RESULT                   |
|-------------------------------|---------------------|--------------------------|
| Answers that are too generic. | RIFORMA in 7 parts. | Outputs ready to verify. |

# The answer is generic because the request leaves too many decisions to AI.

When you write one line, the model has to guess the objective, audience, criteria, limits, and output format.

## WEAK REQUEST

"Create a plan to launch my brand."

The sentence identifies a topic, but it does not define the operational result. The model is free to choose duration, market, budget, channels, priorities, and level of detail.

## WHAT IS MISSING

Result: what decision or document do you need?

Information: brand, audience, market, and available data.

Rules: budget, exclusions, sources, and deadlines.

Output: table, plan, checklist, or email.

## CORE RULE

AI does not automatically know your business. A short request can work when the task is simple and the necessary context is already in the conversation. In other cases, the more decisions you leave implicit, the more generic or difficult to use the result will be.

# You do not need a longer prompt. You need a clearer brief.

A professional prompt is not a magic formula: it is a small operational specification.

**1****Define the problem**

Which activity, decision, or document do you want to improve?

**2****Provide useful material**

Add facts, data, examples, and relevant information.

**3****Set the rules**

Establish limits, exclusions, priorities, and criteria.

**4****Design the output**

Explain how the response should be organized.

**5****Plan the review**

State what must be checked before the output is used.

**PURPOSE OF THIS GUIDE**

Build requests that produce understandable, verifiable outputs ready for the next step. The RIFORMA Method helps you decide what to communicate before opening ChatGPT, Claude, or another AI tool.

# RIFORMA turns one request into seven explicit decisions.

Not every task requires every element, but important professional work benefits from the complete structure.

**R****RESULT**

What should AI produce, and for what purpose?

**I****INFORMATION**

Which context, audience, data, and sources should it use?

**F****FUNCTION / ROLE**

Which perspective should it use, and with which criteria?

**O****OUTPUT**

How should the response be organized and presented?

**R****RULES**

Which constraints, exclusions, and limits must it follow?

**M****MODEL**

Which example or structure shows the desired result?

**A****APPROVAL**

What must a person verify before use?

# Start with the result, not the tool.

The result describes what should exist at the end: a decision, draft, table, plan, or checklist.

## WEAK

"Help me with the launch."

It is unclear which deliverable is needed, by when, for which decision, and with what level of detail.

## MORE USEFUL

"Create a 30-day organic launch plan that helps me decide weekly activities, priorities, and KPIs."

The result is visible and linked to a concrete use.

## Questions to ask yourself

- Which problem should this help me solve?
- Which decision or activity comes after this output?
- How will I recognize a complete and usable response?
- Which part must not be decided by AI?

## PRACTICAL FORMULA

"Produce [DELIVERABLE] to help me [USE / DECISION]. The result is complete when it contains [COMPLETION CRITERIA]."

# Provide the context that genuinely changes the answer.

Useful information does not mean pasting everything. It means selecting what the model needs to know to do the work well.

## INCLUDE

- The recipient or customer.
- The objective of the project or activity.
- Confirmed facts and available data.
- Tools, channels, or processes already in use.
- The reference date and period being analyzed.
- Real examples when they help clarify the context.

## DO NOT ADD UNLESS NEEDED

- Unnecessary personal data.
- Passwords, credentials, or access details.
- Confidential information without authorization.
- Entire archives when a few extracts are enough.
- Unverified numbers or claims presented as facts.
- Documents without explaining which parts matter.

## CONTROL PRINCIPLE

Give AI enough context to reduce assumptions, but minimize the data. For real work, use only approved sources and state which information is confirmed, estimated, or still requires verification.

# A role is useful when it changes perspective, criteria, or technical level.

It does not turn the model into a licensed professional and does not replace data, sources, or verification.

## RECOMMENDED FORMULA

Act as [SPECIFIC ROLE], responsible for [TASK], for [AUDIENCE OR RESULT]. Evaluate the work using [CRITERIA].

## When to use it

- When you want a specific professional perspective.
- When tone, audience, or evaluation criteria should change.
- When you want a critical review, comparison, or simulation.
- When the same role should remain consistent across several steps.

### “ACT AS...”

Better for a single operational request. It assigns a temporary perspective connected to the task.

#### Example:

Act as a project coordinator responsible for turning these notes into decisions, actions, owners, and deadlines.

### “YOU ARE...”

It can work for a persistent persona or assistant, but it tends to be generic unless the task is also defined.

#### Example:

You are a B2B writing tutor. Keep this role during the next revisions and consistently apply the stated criteria.

# Design the response format before generating it.

"Give me a good answer" does not define how the work should be read, checked, or reused.

Define at least four aspects

1

## FORMAT

Table, email, checklist, report, matrix, JSON, or presentation.

2

## STRUCTURE

Sections, order, headings, and mandatory fields.

3

## LEVEL

Concise, operational, technical, executive, or customer-facing.

4

## LENGTH

Number of points, paragraphs, pages, or word limit.

### OUTPUT EXAMPLE

Organize the result in a table with these columns:

Week | Activity | Objective | Owner | Estimated Cost | KPI | Items to Verify.

# Constraints protect the result from unhelpful or risky choices.

Rules state what AI should prioritize, avoid, verify, or leave unresolved.

## POSITIVE RULES

Prioritize: organic activities that one person can execute.

Use: only the data and sources provided.

Flag: assumptions, missing information, and uncertainty.

Order: actions by impact and ease of execution.

## LIMITS AND EXCLUSIONS

Do not invent: market data, prices, sources, or results.

Do not propose: paid advertising during the first week.

Do not create: unapproved commitments, deadlines, or promises.

Do not use: unnecessary personal data.

## PROFESSIONAL RULE

Constraints should be verifiable. "Be creative" is guidance; "propose three options below \$500 and state the assumptions" is an operational rule.

# One example often clarifies more than many instructions.

A model shows the pattern, level of detail, and desired form without forcing AI to copy the content.

## MODEL OF ONE PLAN ROW

| ACTIVITY                        | OBJECTIVE                 | KPI                    | TO VERIFY             |
|---------------------------------|---------------------------|------------------------|-----------------------|
| Interview 5 potential customers | Validate the main problem | 5 completed interviews | Questions and consent |

## How to use the model

- Show one ideal row, paragraph, or section.
- Clarify which elements are structure and which are example content.
- Explicitly tell AI not to invent missing data to imitate the model.
- Use negative examples when you want to prevent recurring mistakes.

### CAUTION

An example reduces ambiguity, but it can also limit variety. Ask for alternatives when you want to explore different approaches, and always verify that the content fits the real case.

# An output becomes operational only after appropriate review.

AI can prepare, organize, and propose. Authority, accountability, and the final decision remain human.

## Choose the review level

### LOW

Examples  
Brainstorming, outline, internal draft

Minimum review  
Quick human check before use

### MEDIUM

Examples  
Customer email, report, operational plan

Minimum review  
Source verification and approval by the work owner

### HIGH

Examples  
Budgets, contracts, people, safety, legal, or compliance

Minimum review  
Qualified review, authoritative sources, and documented approval

### MINIMUM CHECKLIST

Verify names, dates, amounts, calculations, links, and attachments. Separate facts, estimates, and recommendations. Check that AI has not invented owners, deadlines, policies, prices, or commitments. Record the reviewer, date, and corrections when the impact is significant.

# From one generic sentence to a complete brand-launch brief.

The example concerns a new Italian food brand in New York with a limited budget.

## BEFORE

“Act as a marketing expert and create a plan to launch my brand.”

**R**

### RESULT

A 30-day organic launch plan.

**I**

### INFORMATION

Italian food brand in New York; local audience; one person executing the work.

**F**

### FUNCTION

Marketing consultant for small food brands with limited budgets.

**O**

### OUTPUT

Weekly table with activity, owner, cost, KPI, and verification.

**R**

### RULES

Maximum budget \$500; no ads in week one; do not invent data.

**M**

### MODEL

Each row: action, objective, owner, deadline, and metric.

**A**

### APPROVAL

List claims, prices, assumptions, and data requiring human review.

# The value is not the opening sentence. It is the structure of the decisions.

This prompt can be adapted to ChatGPT, Claude, or other generative AI assistants.

## RIFORMA PROMPT

Act as a marketing consultant specialized in launching small food brands with limited budgets.

RESULT: create a 30-day organic launch plan that makes it possible to decide weekly activities, priorities, and KPIs.

INFORMATION: the project is a new Italian food brand in New York. The initial audience is local. One person will manage the work, and the brand already has a logo, photographs, and a showcase website.

OUTPUT: organize the plan in a table with week, activity, objective, owner, estimated cost, KPI, and items to verify.

RULES: maximum budget of \$500. Do not include paid advertising during the first week. Prioritize realistic organic activities. Do not invent market data or expected results. Use 'To verify' whenever a source is missing.

MODEL: each activity must state the action, purpose, deadline, and metric.

APPROVAL: at the end, list claims, prices, assumptions, sources, and decisions that require human review before use.

## WHAT TO EXPECT

Expect a starting point that is closer to real work, not a perfect answer. Verify facts and assumptions, then request one focused revision at a time.

# Use a structure that is proportional to the task.

A simple extraction does not need the same brief as a commercial plan or a customer-facing document.

## ESSENTIAL RIFORMA

For simple, low-risk tasks.

R - Result  
I - Information  
O - Output  
R - Rules

Example: extract decisions, actions, and dates from these notes.  
Use a table and write "To confirm" for every missing item.

## PROFESSIONAL RIFORMA

For work involving several people, sources, criteria, or consequences.

R - Result  
I - Information  
F - Function  
O - Output  
R - Rules  
M - Model  
A - Approval

## Signs that you need the complete version

- The output will be shared with customers, managers, or stakeholders.
- Budgets, deadlines, people, contracts, or sensitive data are involved.
- Multiple sources must be compared or reconciled.
- The response must enter a process or be reused by the team.
- An error could create costs, promises, or incorrect decisions.

# Prepare the brief before opening the AI tool.

Complete the fields. Remove those you do not need. Keep only approved information.

**R - RESULT**

Which deliverable, decision, or activity should it produce?

---

**I - INFORMATION**

Which context, audience, sources, data, and reference date are needed?

---

**F - FUNCTION**

Which role or perspective is relevant? Which criteria should it use?

---

**O - OUTPUT**

Which format, structure, level, and length do you want?

---

**R - RULES**

What should it prioritize, avoid, verify, or leave unresolved?

---

**M - MODEL**

Which example or pattern shows the desired form?

---

**A - APPROVAL**

Who checks what before use?

---

# Do not stop at the prompt. Turn a real activity into a workflow.

The prompt is only one component: you also need sources, steps, responsibilities, controls, and measures.

**1****CHOOSE**

A recurring activity that takes too much time or requires too many corrections.

**2****TEST**

Use RIFORMA on a real, non-sensitive case.

**3****MEASURE**

Compare time, errors, and quality with the previous method.

**4****STANDARDIZE**

Save the instructions, output, reviewer, and update rules.

## MINI WORKFLOW REVIEW

Do you have a recurring activity that takes too much time, includes too many manual steps, or requires too many corrections?

Describe the process and identify with AI PM Lab:

- the main problem;
- the steps suitable for AI;
- the necessary human controls;
- the first measurable test.
